

Coordinates, Now with More Dimensions....

2D Coordinates

Variables: x (indep), y (dep)

Axes: x -axis \perp y -axis

Coordinates of a point: (a, b)

Go a units in x -direction, b in y .

Projection onto x -axis: $(a, 0)$

(drop a line \perp from point to x -axis.)

Distance from origin: $\sqrt{a^2 + b^2}$

First quadrant:

All points (a, b) with $a \geq 0$, $b \geq 0$.

3D Coordinates

Variables: x , y (indep), z (dep)

Axes: x -axis \perp y -axis \perp z -axis

(right hand rule)

Coordinates of a point: (a, b, c)

Go a units in x -dir, b in y , c in z .

Projection onto xy -plane: $(a, b, 0)$

(drop a line \perp from point to xy -plane)

Distance from origin: $\sqrt{a^2 + b^2 + c^2}$

First **octant**:

All points (a, b, c) with $a, b, c \geq 0$

Continued Comparison

2D Equations

Lines:

$x = 2$ defines a vertical line.

All points $(2, b)$ for any b

$y = 3$ defines a horizontal line.

All points $(a, 3)$ for any a

Circles:

All points distance r from (h, k) :

$$x^2 + y^2 = r^2$$

$$(x - h)^2 + (y - k)^2 = r^2$$

3D Equations

Planes:

$x = 2$ is a plane parallel to the yz -plane.

All points $(2, b, c)$ for any b, c .

$x = y$ defines a plane too.

All points (a, a, c) for any a, c .

Spheres:

All points distance r from (h, k, ℓ) :

$$x^2 + y^2 + z^2 = r^2$$

$$(x - h)^2 + (y - k)^2 + (z - \ell)^2 = r^2$$

Vectors

Definition: A **vector** is a quantity that has both magnitude and direction, often represented by an arrow. We'll use either \mathbf{v} , \vec{v} , or $\vec{\mathbf{v}}$.

- ▶ Think of them as a generalization of a single number.
- ▶ They do not have a fixed position.
- ▶ Can have any number of dimensions.

What can we do with vectors?

We can add vectors.

Place the tail of \vec{v} at the head of \vec{u} .

Define $\vec{u} + \vec{v}$ to be the vector starting at the tail of \vec{u} and ending at the head of \vec{v} .

Properties: $\vec{u} + \vec{0} = \vec{u}$

$\vec{u} + \vec{v} = \vec{v} + \vec{u}$. (Parallelogram!)

We can stretch vectors

by a constant factor (a **scalar**).

Zero Properties:

$$0 \cdot \vec{v} = \vec{0} \quad \text{and} \quad c \cdot \vec{0} = \vec{0}$$

So we can subtract vectors,

because $\vec{u} - \vec{v} = \vec{u} + (-1)\vec{v}$.

Distributive laws:

$$(a + b) \cdot \vec{v} = a \cdot \vec{v} + b \cdot \vec{v}$$

$$c \cdot (\vec{u} + \vec{v}) = c \cdot \vec{u} + c \cdot \vec{v}$$

Grasping the magnitude of the situation

To write a vector in coordinates, place the tail at the origin and find the coordinates of the head.

▶ $\vec{u} = \langle 1, 4, 3 \rangle$, then $|\vec{u}| =$.

▶ $\vec{v} = \langle 0, -1, -3 \rangle$, then $|\vec{v}| =$.

Three special vectors: $\vec{i} = \langle 1, 0, 0 \rangle$, $\vec{j} = \langle 0, 1, 0 \rangle$, $\vec{k} = \langle 0, 0, 1 \rangle$.

▶ Alternate form: $\vec{u} = \vec{i} + 4\vec{j} + 3\vec{k}$. **standard basis vectors**

We add vectors componentwise. And multiply scalars componentwise.

▶ $\vec{u} + \vec{v} = \langle 1 + 0, 4 + (-1), 3 + (-3) \rangle = \langle 1, 3, 0 \rangle$

▶ $\pi\vec{u} = \pi\langle 1, 4, 3 \rangle = \langle \pi, 4\pi, 3\pi \rangle$ Stretch it!

Magnitude is a synonym for **length**, written $|\vec{v}|$ or $\|\vec{v}\|$.

You may need to find the **unit vector** in the same direction as \vec{u} .

▶ Find the length of \vec{u} and divide by it!

▶ **Example.** Unit vector of $\langle 2, -1, -2 \rangle$ is

Vectors are the best way to understand Physics

Example. A 100 lb weight hangs from the ceiling. How much force is held by each rope?

Answer: The forces must be in equilibrium.

This means that the sum of all the forces equals $\vec{0}$.

- ▶ Set up a coordinate system centered at the rope meeting place.
- ▶ Find the force vector on each rope.
 - ▶ The weight down gives $\vec{W} = \langle 0, -100 \rangle$.
 - ▶ The first force $\vec{F}_1 = F_1 \langle \underline{\hspace{2cm}} \rangle$ (magnitude · direction)
 - ▶ The second force $\vec{F}_2 = F_2 \langle \underline{\hspace{2cm}} \rangle$
- ▶ Use equilibrium to get a system of equations, solve.

$$-\cos 50 F_1 + \cos 32 F_2 = 0 \quad \text{and} \quad \sin 50 F_1 + \sin 32 F_2 - 100 = 0$$

Solving gives $F_1 \approx 85$ lb and $F_2 \approx 65$ lb.
